

Front end

BASIC REQUIREMENTS TO BUILD A WEBSITE

HTML

*Must
Body*

CSS

beauty

JAVASCRIPT

brain

LET US UNDERSTAND THIS WITH A FRIENDLY EXAMPLE

Engine, ABC
(JS)

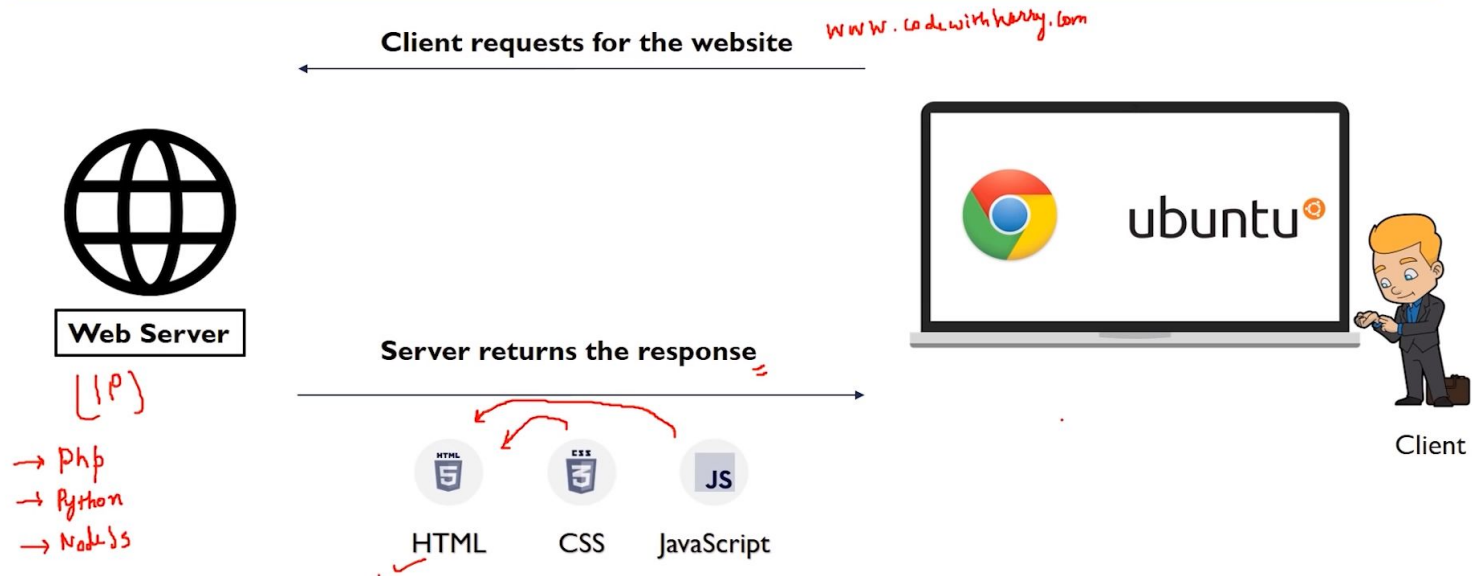

Metallic body.
(HTML)

Color, designs, decors.
(CSS)

'Css + javaScript' wrapped and present in the 'html'

HOW WEBSITES WORK?

Suppose we hit “www.facebook.com” on the browser

As soon as we hit the end point on the browser it will call the server and get the document of the “Html(css+js) in it” and browser starts reading the docs of frontend

ROLE OF HTML

HTML

- HTML stands for Hypertext Markup Language
- It is basically a standard markup language for giving a static skeleton to web application and websites.
- Its a well standardized system

ROLE OF CSS

CSS

- Cascading Style Sheets which is known as CSS is a style sheet language that used to handle the presentation of the web page containing HTML.
- It makes our websites beautiful and modern looking.

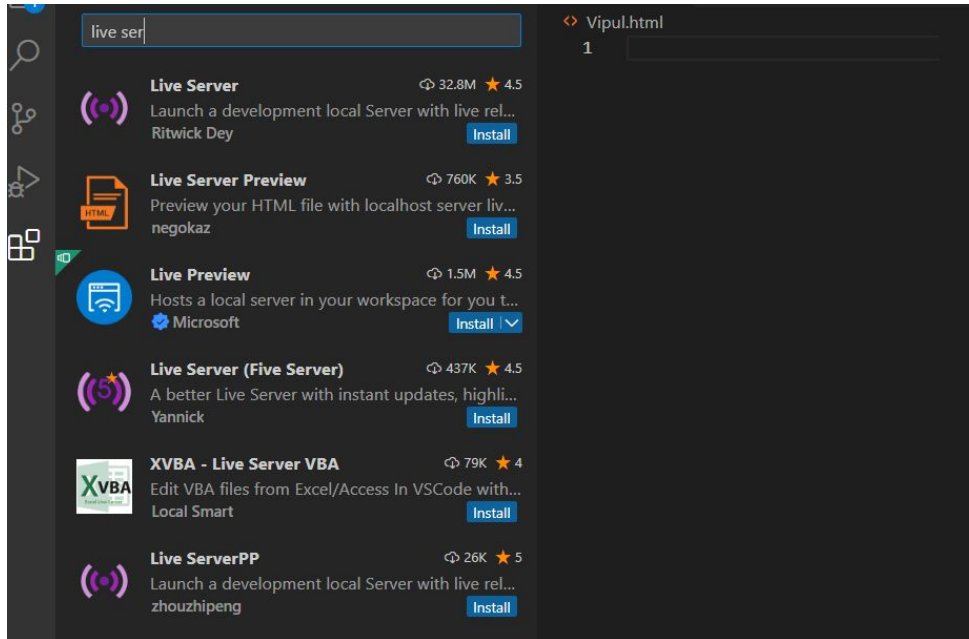

ROLE OF JAVASCRIPT

JavaScript

- JavaScript which is often known as JS, is a high-level dynamic interpreted programming language.
- It allows client-side scripting to create completely dynamic web applications and websites.

Now we will download the VS code and add “live server” extension to it

We will download the first one

After adding “live server”, we can see the “Go Live” button in the bottom right corner

Suppose we write “!” it provides us a “Emmet Abbreviation”
Or we can say it will provide us the “boilerplate code”

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>vipulwa</title>
</head>
<body>
  hello world
</body>
</html>
!
```

Now we hit the “live server” on the vs code so it will open a page on our default browser

hello world

Let's understand the head of the html

```
<!DOCTYPE html>
<!-- comments -->
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>vipul and vimarsh </title>
</head>
<body>
  hello world vimmuwec
</body>
</html>
```

What is the function of <meta> tag: it is mainly used in SEO(search engine optimization) : it means we help the google or bing search engine to show our website more fast to the user

Understanding more meta<> tags

```
<meta name="description" content="this is description of my page">
```

The `meta` tag with the `name` attribute set to "description" is used to provide a brief summary or description of the webpage's content. This information is often used by search engines to display a snippet of text in search results.

```
<meta name="keywords" content="html,css,javascript">
```

The `meta` tag with the `name` attribute set to "keywords" is used to specify a list of relevant keywords or phrases related to the content of the webpage. This tag was widely used in the past, but search engines now mostly ignore it due to spam and keyword stuffing issues.

```
<meta name="robots" content="NOINDEX, NOFOLLOW">
```

The `meta` tag with the `name` attribute set to "robots" is used to instruct search engine crawlers on how to index and follow links on the webpage. In this example, the `NOINDEX` value tells crawlers not to include the page in their index, and the `NOFOLLOW` value tells them not to follow any links on the page.

It's worth noting that these tags are not visible to website visitors, but are instead included in the HTML code of the webpage.

But who are crawlers ?

Crawlers, also known as spiders or bots, are automated programs used by search engines to explore the web and index web pages. These programs visit web pages and follow links to discover new pages to index. They analyze the content and structure of each page they visit and store information about it in the search engine's database, which is later used to provide relevant search results to users.

Crawlers are also used by other types of web services, such as web archiving services, website monitoring tools, and content scraping tools. The behavior of crawlers can be controlled by website owners using various techniques such as robots.txt files and the use of `noindex` and `nofollow` meta tags.

How can we provide our **css** and **js** file in the html

```
<!DOCTYPE html>
<!-- comments -->
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="this is description of my page">
  <meta name="keywords" content="html,css,javascript">
  <meta name="robots" content="NOINDEX, NOFOLLOW">
  <title>vipul and vimarsh </title>

  <!-- This is how you can include external css -->
  <link rel="stylesheet" href="vipul.css"><!--this is how we provide our "vipul.css" file to html-->

  <!-- This is how you include external JavaScript -->
  <script src="vipul.js"></script><!--this is how we provide our "vipul.js" file to html-->

</head>
<body>
  hello world vimmuwec
</body>
</html>
```

Suppose we want to add something in the body

Like this **Header** the **subheader** and the one more **subheader** after that **paragraph**

```
<!DOCTYPE html>
<!-- comments -->
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>vipul and vimarsh </title>
</head>
<body>
  <h1>Gunnu</h1>
  <h2>Gunnu</h2>
  <h3>Gunnu</h3>
  <p>This is Gunnu</p>

</body>
</html>
```

We can add upto `<h6>Gunnu</h6>` six headers in the html

Suppose, we want to make some text bold in the paragraph

```
<body>
  <h1>Gunnu</h1>
  <h2>Gunnu</h2>
  <p>This is <strong>Gunnu</strong> in paragraph</p>
  <p>this is gunnu in next paragraph</p>
</body>
```

Suppose, we want to make some text italic(or we can say emphasized) in the paragraph

```
<body>  
  <h1>Gunnu</h1>  
  <h2>Gunnu</h2>  
  <p>This is <strong>Gunnu</strong> in paragraph</p>  
  <p>this is <em>gunnu</em> in next paragraph </p>  
</body>
```

Suppose, we want to make some text to go in to the next line in the paragraph

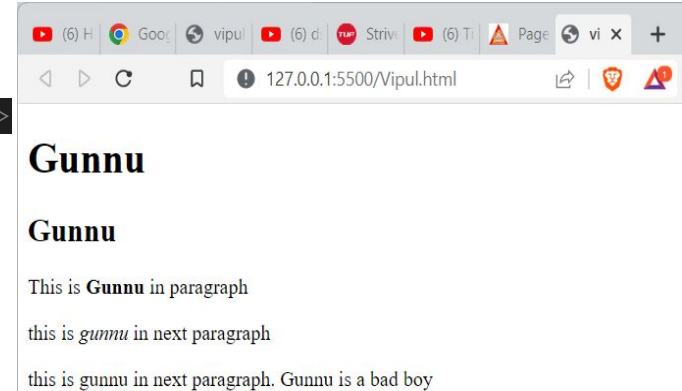

```
<body>
  <h1>Gunnu</h1>
  <h2>Gunnu</h2>
  <p>This is <strong>Gunnu</strong> in paragraph</p>
  <p>this is <em>gunnu</em> in next paragraph</p>
  <p>this is gunnu.
```

```
    Gunnu is a bad boy</p>
```

```
</body>
```

Even though I have provided the next line to `<p>` paragraph, but “gunnu is a bad boy” come in the same line, because HTML doesn’t consider the extra spaces

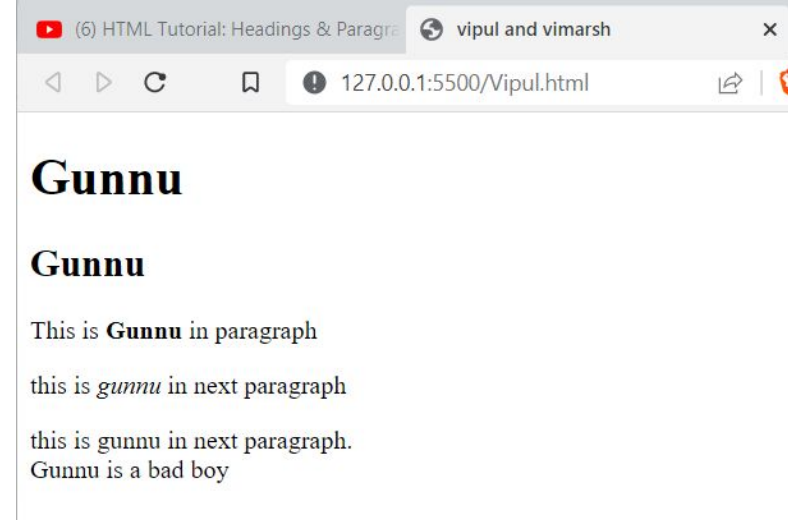

So, what we will do

Suppose, we want to make some text to go in to the next line in the paragraph

```
<body>
  <h1>Gunnu</h1>
  <h2>Gunnu</h2>
  <p>This is <strong>Gunnu</strong> in paragraph</p>
  <p>this is <em>gunnu</em> in next paragraph</p>
  <p>this is gunnu.<br>Gunnu is a bad boy</p>
</body>
```

 is a self closing tag, because we just need to change the line only.

Suppose, we want a line ruler in the paragraph

```
<body>
  <h1>Gunnu</h1>
  <h2>Gunnu</h2>
  <p>This is <strong>Gunnu</strong> in paragraph</p>
  <p>this is <em>gunnu</em> in next paragraph</p>
  <p>this is gunnu in next paragraph. <br>Gunnu is a bad boy</p>
  <hr>
  <p>this is vipul </p>
</body>
</body>
```

Gunnu

Gunnu

This is **Gunnu** in paragraph

this is *gunnu* in next paragraph

this is gunnu in next paragraph.
Gunnu is a bad boy

this is vipul

Links , Images and Anchor tags

Suppose we want to attach the link to our web page

```
<!DOCTYPE html>
<!-- comments -->
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>Links and images </title>
</head>
<body>
  <a href="https://www.youtube.com">go to youtube</a>
</body>
</html>
```

Now we can see the hyperlink text
on our page

One more example of link with added header

```
<!DOCTYPE html>
<!-- comments -->
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>Links and images </title>
</head>
<body>
  <a href="https://www.youtube.com">go to youtube</a>
  <h1>google</h1>
  <a href="https://www.google.com/">go to google</a>
</body>

</html>
```

result

Suppose we want to open a new tab when we click on that hyperlink

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Links and images </title>
</head>
<body>
```

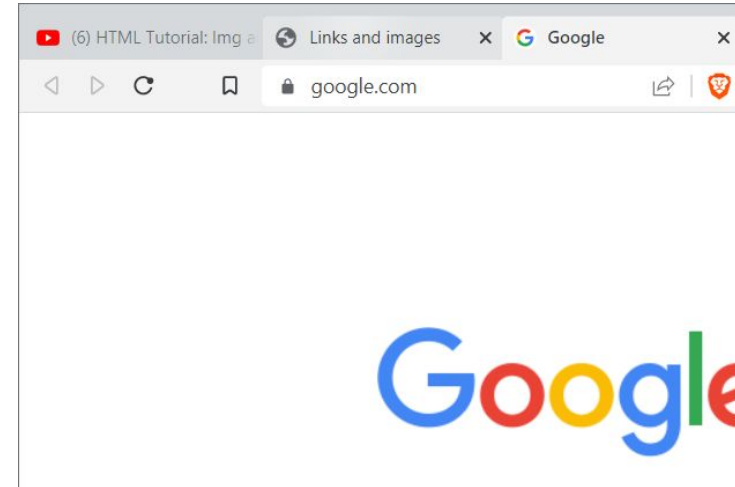

```
<a href="https://www.google.com" target="_blank">go to google</a>
```

```
</body>
</html>
```

result

Now when we click on the link a new tab get open

What if you wanna add your html page

```
<!DOCTYPE html>
<!-- comments -->
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>Links and images </title>
</head>

<body>

  <a href="https://www.google.com" target=" blank">go to google</a><br>
  <a href="https://www.yahoo.com" target=" blank">go to yahoo</a><br>
  <a href="/Test.html" target=" blank">my own html page</a>

</body>

</html>
```

This “**Test.html**” is my own file

Result

Let's add Images in our web page

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Links and images </title>
</head>

<body>

  <a href="https://www.google.com" target="_blank">go to google</a><br>

  <!-- Image is not present hence "alt" text is shown, because "Planet9_3840x2160.jpg" is not present
  anywhere -->
  

  <!-- I have taken this from a website which generate random images -->
  

  </body>

</html>
```

We have to provide the image path to the “src”, if doesn't find anything it will print the “alt” part

Result

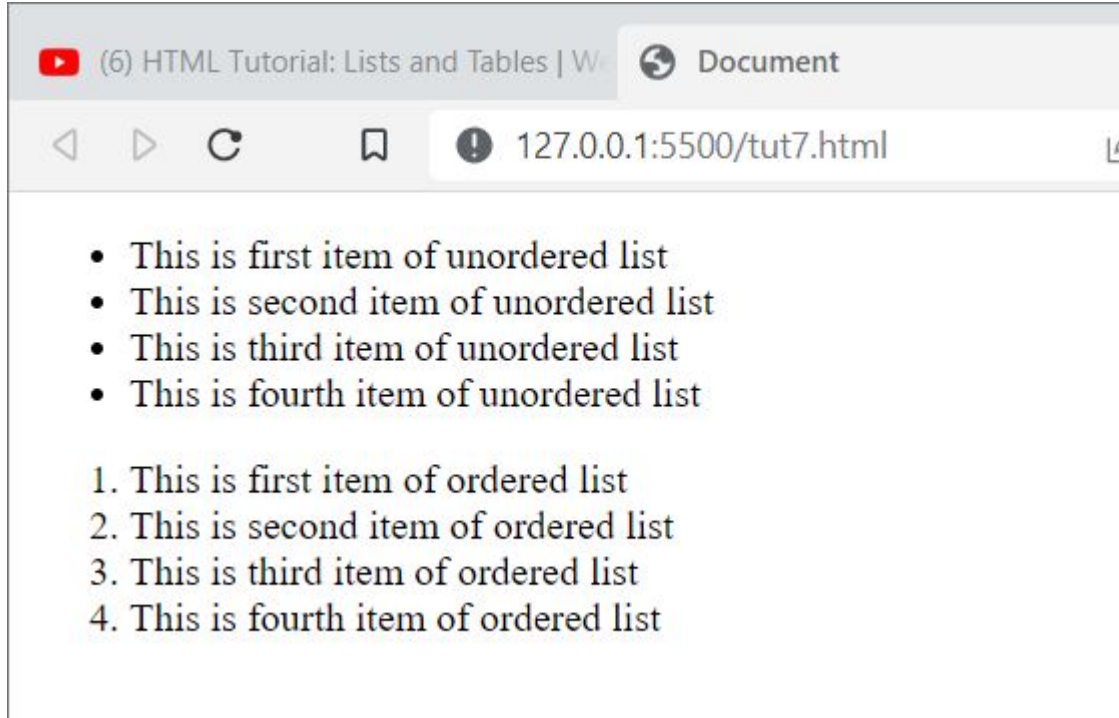

Lists and Tables (tut-7)

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Document</title>
</head>
<body>
  <ul>
    <li>This is first item of unordered list</li>
    <li>This is second item of unordered list</li>
    <li>This is third item of unordered list</li>
    <li>This is fourth item of unordered list</li>
  </ul>

  <ol>
    <li>This is first item of ordered list</li>
    <li>This is second item of ordered list</li>
    <li>This is third item of ordered list</li>
    <li>This is fourth item of ordered list</li>
  </ol>
</body>
</html>
```

Result

well, default numbering of ordered list is in number

well, we can also change it

Lists and Tables (tut-7) change in the order list

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Document</title>
</head>
<body>
  <ul>
    <li>This is first item of unordered list</li>
    <li>This is second item of unordered list</li>
    <li>This is third item of unordered list</li>
    <li>This is fourth item of unordered list</li>
  </ul>
  <ol type="a">
    <li>This is first item of ordered list</li>
    <li>This is second item of ordered list</li>
    <li>This is third item of ordered list</li>
    <li>This is fourth item of ordered list</li>
  </ol>
</body>
</html>
```

We can put
'1' for number
'A' for capital alphabet
'a' for small alphabet
'i' for small roman number
'I' for large roman number

Result

- This is first item of unordered list
- This is second item of unordered list
- This is third item of unordered list
- This is fourth item of unordered list

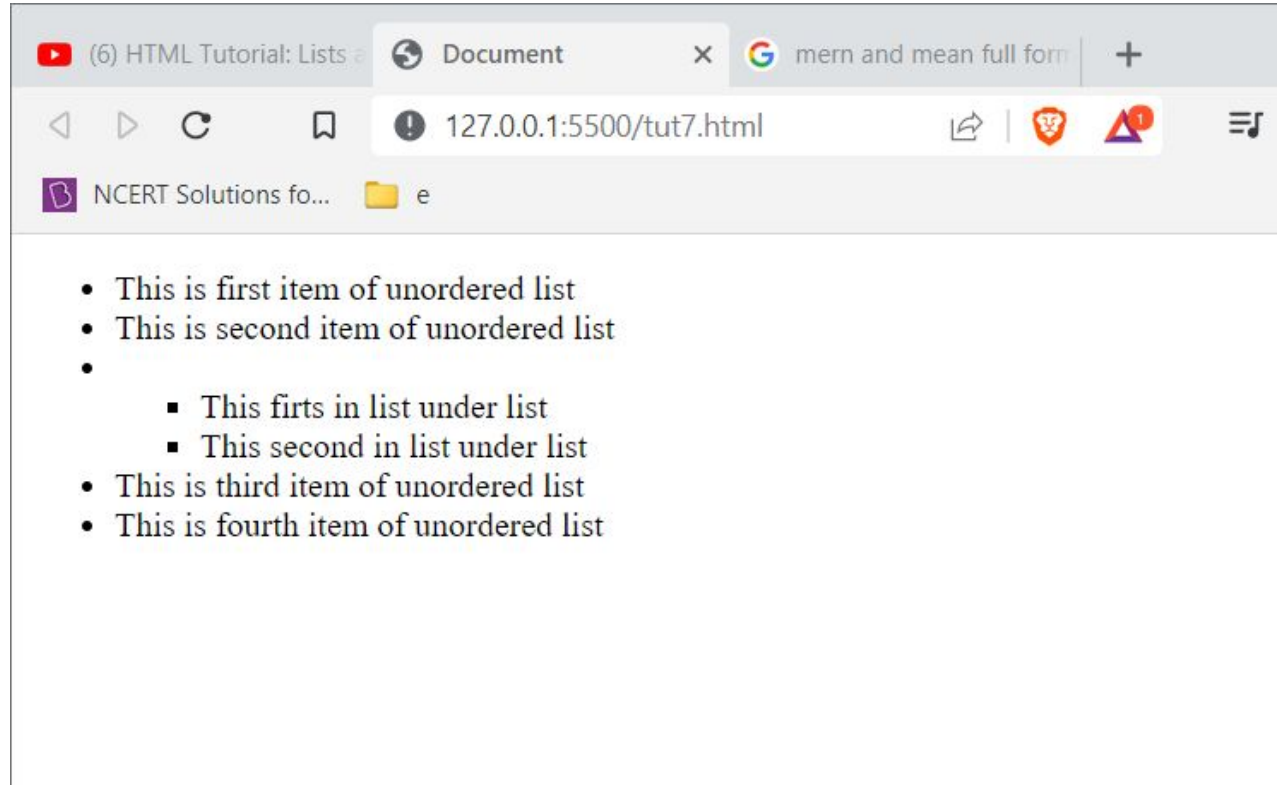

- a. This is first item of ordered list
- b. This is second item of ordered list
- c. This is third item of ordered list
- d. This is fourth item of ordered list

Lists and Tables (tut-7) List under list

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Document</title>
</head>
<body>
  <ul>
    <li>This is first item of unordered list</li>
    <li>This is second item of unordered list</li>
    <li>
      <ul type="square">
        <br>
        <li>This first in list under list </li>
        <li>This second in list under list </li>
      </ul>
    </li>
    <li>This is third item of unordered list</li>
    <li>This is fourth item of unordered list</li>
  </ul>

</body>
</html>
```

Result

Lists and Tables (tut-7) Tables

```
<body>  
<h3>HTML Table</h3>
```

```
<table>  
  <thead>  
    <tr>  
      <th>Name</th>  
      <th>class</th>  
      <th>Roll no</th>  
    </tr>  
  </thead>
```

Header of the table

Table row

```
    <tbody>  
      <tr>  
        <td>vipul</td>  
        <td>tenth</td>  
        <td>5252510</td>  
      </tr>
```

```
      <tr>  
        <td>vimmu</td>  
        <td>seventh</td>  
        <td>14</td>  
      </tr>
```

```
      <tr>  
        <td>d</td>  
        <td>indrap</td>  
        <td>1</td>  
      </tr>
```

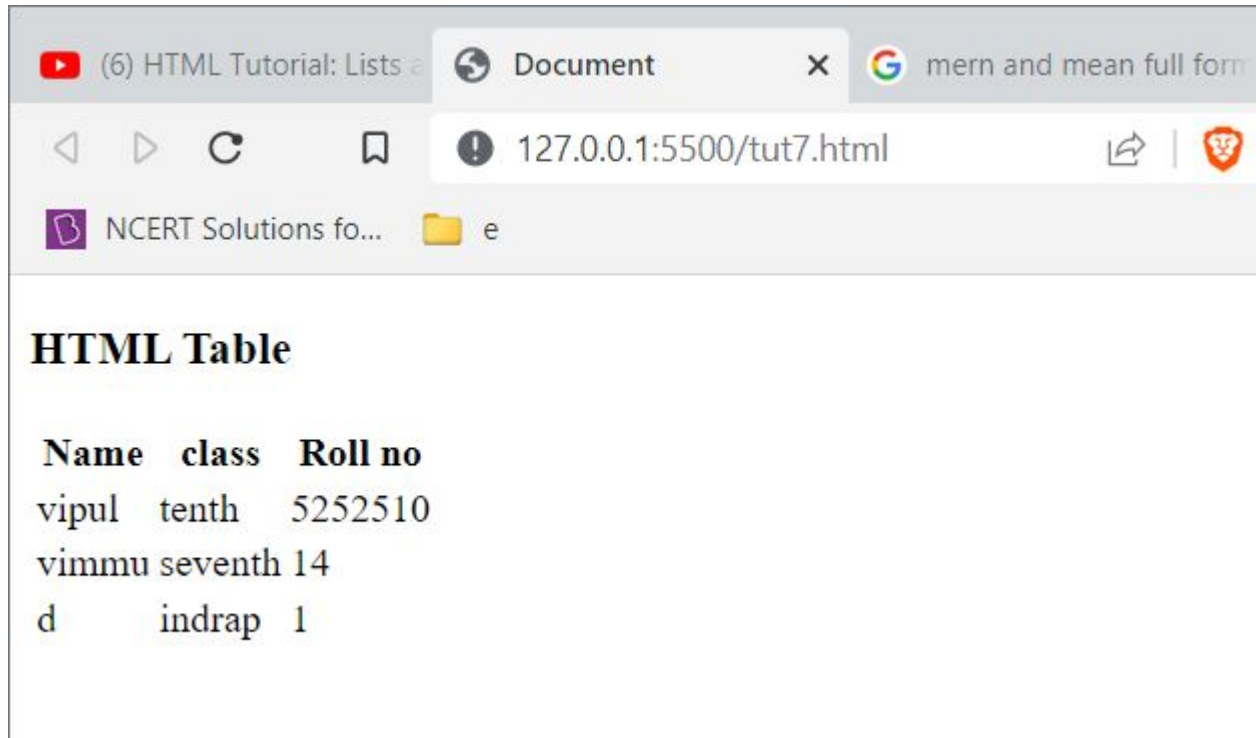

```
    </tbody>  
</table>
```

```
</body>
```

Table have mainly two things:

1. Table Head
2. Table Body

Result

Forms and Input Tags (tut8.html)

```
<!DOCTYPE html>
<html lang="en">
<head>

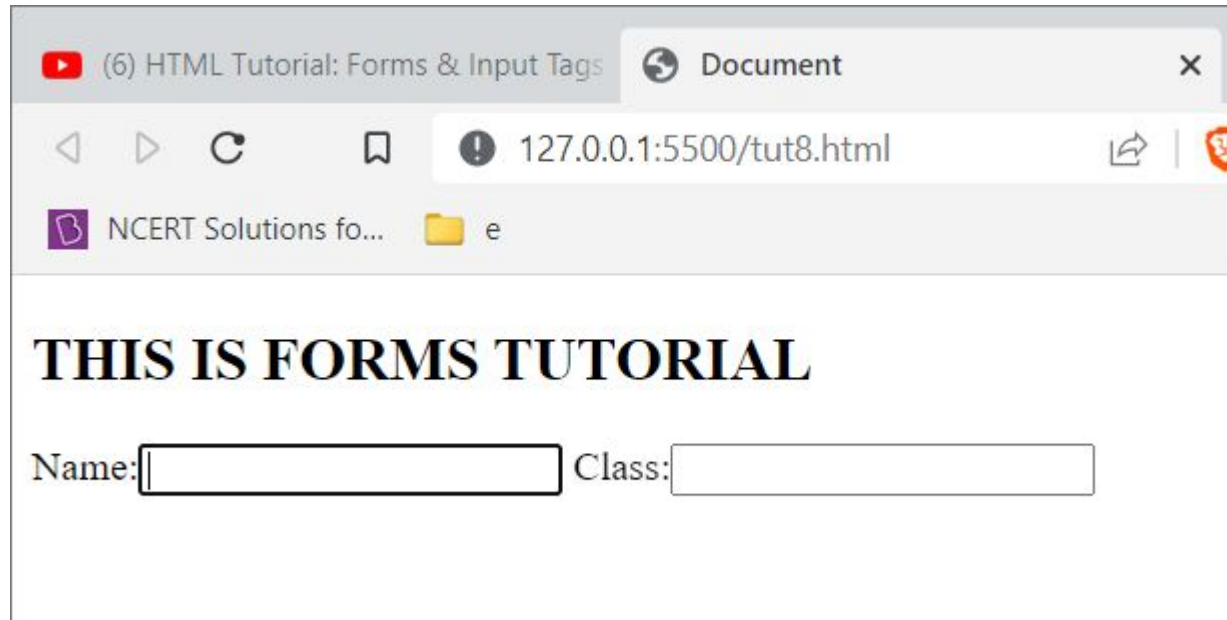

</head>

<body>
  <h2>THIS IS FORMS TUTORIAL</h2>
    <form action="tracker-server_backend.">
      Name:<input type="text">
      Class:<input type="text">
    </form>
</body>

</html>
```

Result

But as we can see, both the fields coming in a same line, we can use `
` tag but It is not conventional here, so we will use `<div></div>` p.t.o

Understanding <div></div>

```
<body>
  <h2>THIS IS FORMS TUTORIAL</h2>
  <form action="tracker-server backend.">
    Name:<input type="text">
    Class:<input type="text">
  </form>
</body>
```

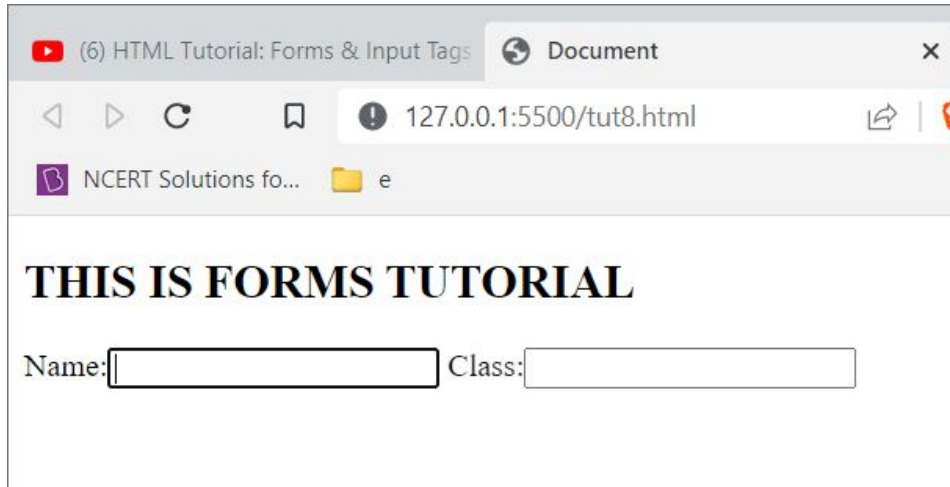

They are inline elements. It means they will take single line, so to change their line we can
 tag but it is not conventional

```
<body>
  <h2>THIS IS FORMS TUTORIAL</h2>
  <form action="tracker-server backend.">
    <div>
      Name:<input type="text">
    </div>
    <div>
      Class:<input type="text">
    </div>
  </form>
</body>
```

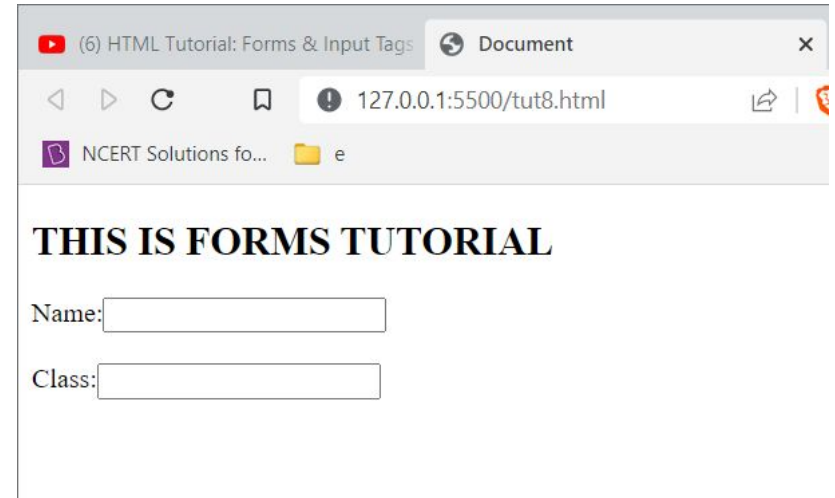

<div></div> is a block element. It will take whole block and force other block to go down

result

Before

After

But how we store these value to any database?

ANSWER: via backend

```
<form action="tracker-server_backend.java">
  <div>
    Name:<input type="text" name="nameText">
  </div>
  <div>
    Class:<input type="text" name="classText">
  </div>
  <div>
    Date:<input type="date" name="formDate">
  </div>
  <div>
    <input type="submit" name="submit">
  </div>
</form>
```

This is the connection of backend

This is the type of text

This is the name of field in which we are providing the data to our backend in json format

Suppose we have a entity in backend which have three field

```
public String nameText;
public String classText;
public Date formDate;
```

So we will assign these Name,Class,Date to the backend entity by submitting the data

Result

127.0.0.1:5500/tut8.html

NCERT Solutions fo... e

THIS IS FORMS TUTORIAL

Name:

Class:

Date:

Submit

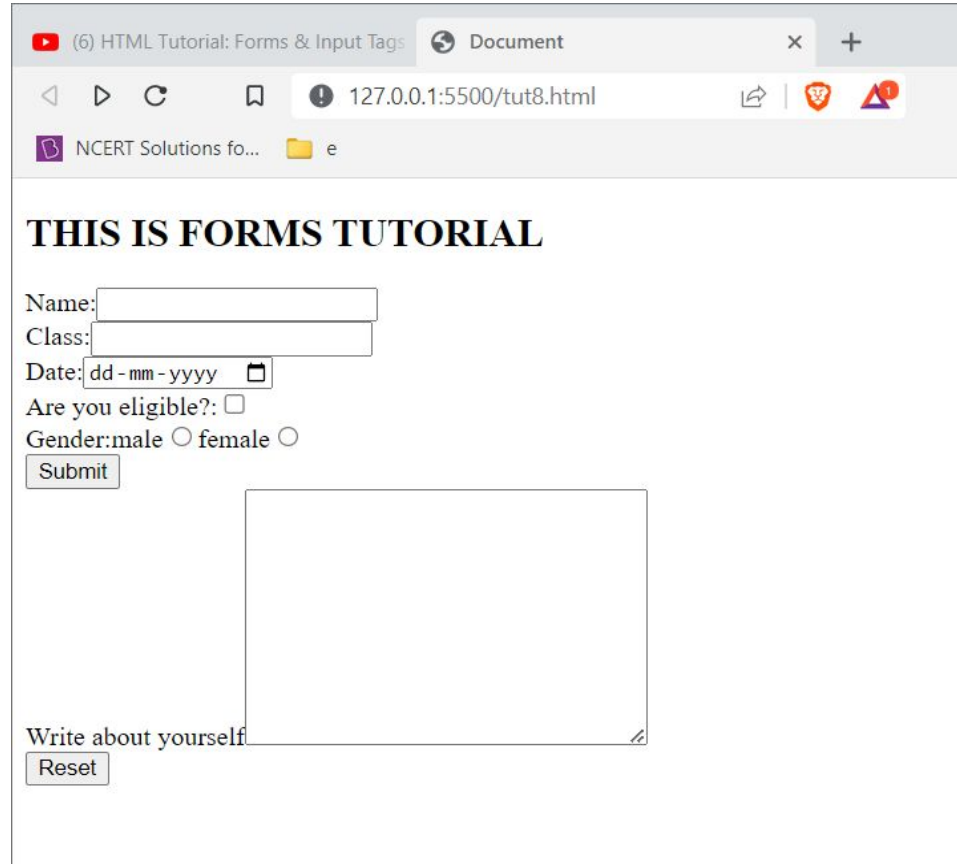

If we submit it, it will throw the error because there is no actual backend present

Forms and Input Tags (tut8.html) more fields in the forms

```
<form action="tracker-server_backend.java" >
  <div>
    Name:<input type="text" name="nameText">
  </div>
  <div>
    Class:<input type="text" name="classtext">
  </div>
  <div>
    Date:<input type="date" name="date">
  </div>
  <div>
    Are you eligible?:< input type="checkbox" name="myEligibilty">
  </div>
  <div>
    Gender:male<input type="radio" name="studentGender">female< input type="radio" name="studentGender">
  </div>
  <div>
    <input type="submit" name="submit">
  </div>
  <div>
    < input type="reset">
  </div>
  <div>
    Write about yourself<textarea type="myText" cols="30" rows="10"></textarea>
  </div>
</form>
```

Result

The screenshot shows a web browser window with the following details:

- Tab:** (6) HTML Tutorial: Forms & Input Tags
- Page Title:** Document
- Address Bar:** 127.0.0.1:5500/tut8.html
- Bookmarks:** NCERT Solutions fo..., e

The form content is as follows:

THIS IS FORMS TUTORIAL

Name:

Class:

Date: 

Are you eligible?: ☐

Gender: male ☐ female ☐

Write about yourself 

Now we will talk about “select”

```
<div>  
  <label for="car">Cars</label>  
  <select name="myCars" id="car">  
    <option value="Suzuki">swift</option>  
    <option value="Tata">selected<nano></option>  
  </select>  
</div>
```

By default nano is
selected

Result

Inline and Block Element

```
<body>  
  <p>this is a paragraph</p>  
  <p>this is a paragraph two</p>  
</body>
```

This `<p></p>` is block element to make the paragraph line same we have to use `` tag instead of `<p></p>` because it is inline element

Result
